

ABSTRACT

Methods, apparatus, and systems, including computer program products, implementing and using techniques for updating a configuration of a device. An indication of an intended action to be performed by the device is obtained. A configuration list of program components required to perform the intended action is prepared based on the intended action and configuration information for the device. For each program component in the configuration list it is determined whether the program component is installed on the device. Each required program component that is not installed on the device is transferred to the device and the program component is installed on the device.
